FUNCTIONING

DANGER!

**BEFORE MANIPULATING INSIDE
THIS MACHINE EXAMINE CAREFULLY
THE DISTRIBUTION OFF VOLTAGES
(FIGURE 1).

AT THE PLACES MARKET WITH «■»
THERE ARE HIGH VOLTAGES, EVEN
WITH THE MACHINE SWITCHED
OFF.**

distribution of voltages
figure 1

INSTALLATION

This machine is ready to play after it has been unpacked. Nevertheless, it is advisable to effect the following checking inside the cabinet before plugging it in:

1. Check there is nothing broken.
2. Check all connectors. Specially the ones of the monitor of the transformer board and MAT.
3. Check that the connection of the transformer reglet is the correct in accordance with the voltage.
4. Check the correct coupling of the tube and the RGB board as well as the condition of the deflector yolk.
5. Check the modifications made to the monitor.

SETTING INTO OPERATION

Once the former checkings have been carried out, proceed to the setting into operation, therefore:

1. Plug the machine to the source of power supply (110 Watt).
2. Close the door and the rear cover.
3. Activate the switch. In 15 seconds the image should appear.

At this stage, carry out the following checkings:

1. Open the door. The internal lights of the machine should lit and the alarm should sound.
2. Open the rear cover. After 10 centim. the machine should disconnect itself completely.

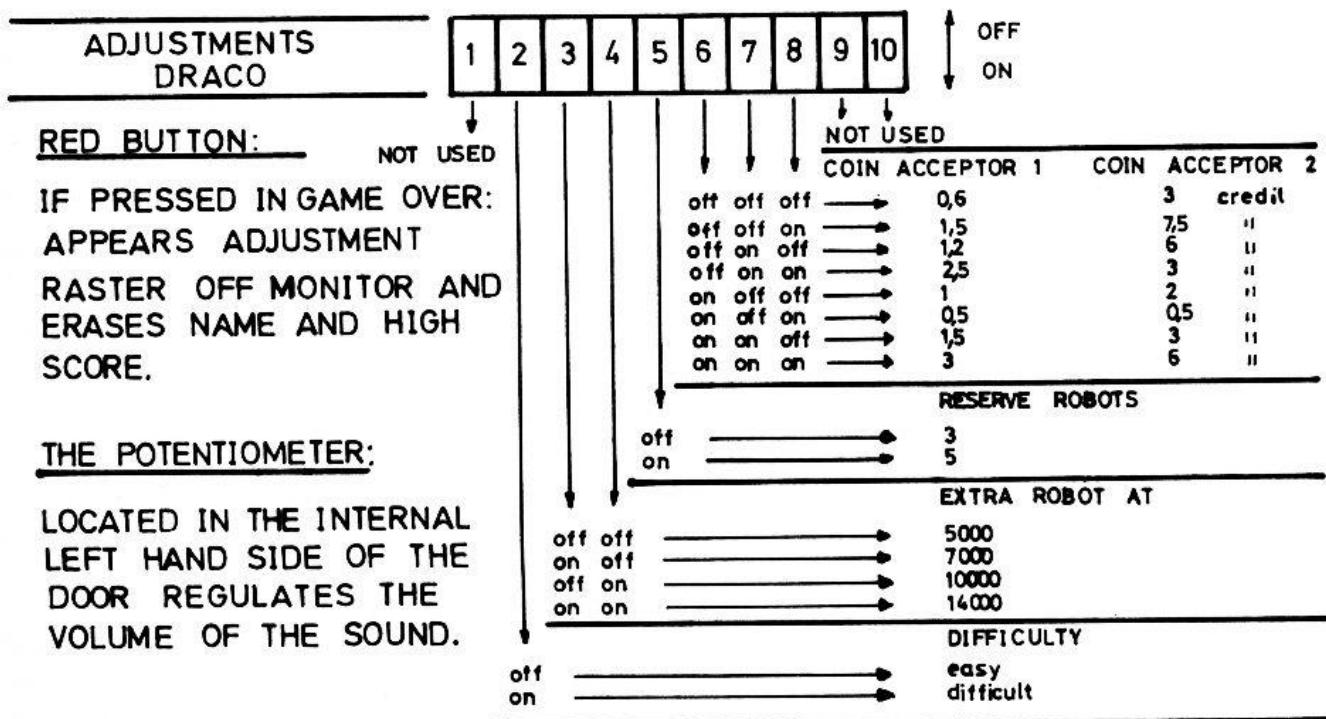

In case of finding a failure in any of the 2 former chapters, check the corresponding switches.

"GAME OVER"

Once the former steps have been taken and with the rear cover closed, the machine must remain in the state of game over with the punctuations chart and alternatively with the name of the model.

In this state adjustments of the machine can be carried out and, pressing the TEST button, an adjustment chart will appear. To surpass the state of TEST, switch off and on the machine.

The adjustments are the following:

When coins are inserted or the microswitches are activated by hand, the credits accumulate in the counter up to a maximum of 15. In this new state, the "Game Over" remains fixed in the screen.

PLAY

Pressing "one player" or "two players", the machine enters in the state of play. Overcoming all the impediments 5 screens will appear, increasing the difficulty after each cycle.

Each screen has a given time to be passed. This time will be more or less long in accordance with the obstacles destroyed.

Once the time is over and not having succeeded in overcoming the obstacles the humanoid remains stretched and falls down, passing to play with another humanoid if there is an spare one.

In the first four screens and in each one of them there are four robots which

regenerate as the player destroys them. Each robot scores 10 points.

Each screen is composed of two phases, using one or other, in accordance with the indicating arrow, located at the bottom of the screen.

The controls command the humanoid and the shooting in 8 different directions.

The characteristics of each screen are the following:

SCREEN 1.-

Irregular forms constituted by ovals.

Mission: To destroy these in order to get the indicated score in their inside.

SCREEN 2.-

Isles and streets.

Mission: To reach the small island with 400 points in its internal side and destroy it. Each street has a given points indicated in it, destroying it will increase the score.

SCREEN 3.-

Isles and streets with rhombs.

Mission: To destroy the rhombs. Each rhomb scores 10 points.

SCREEN 4.-

Irregular forms constituted by squares.

Mission: To destroy these in order to get the score indicated in its internal side.

SCREEN 5.-

Huts.

Mission: To destroy the number inside of them avoiding the vertical band which runs over the image.

WRITING

This is achieved when the HIGH SCORE has been surpassed. Then the player can write his name. In order to do this the left control is used to fix the position and the right control to select the letter. After a few seconds the machine returns to the state of "GAME OVER".

The names of the five players getting the high scores will remain in the screen.

In any of the former states it is possible to regulate the volume by means of a potentiometer located in the platform of the game.

MAINTENANCE

CHANGE OF VOLTAGE

The change of voltage is carried out by the reglet located on top of the transformer. The red-green wire must be in the proper place corresponding to the voltage of the power supply.

To the ventilator and the fluorescent light always go 220 V.

The internal plug, also located on top of the transformer, receives the voltage of the power supply and is not affected by the power supply switch.

SUBSTITUTION OF BOARDS

In general it is advisable to disconnect the harnesses in decreasing order with reference to the voltage and connect them in order increasing with reference to the voltage.

A.- PLAY, SOUND: They do not require special precaution, only the necessary ones to grant the integrity of same.

B.- RGB: Disconnect the focus cable. To do so use the aerial connector or directly from the socket depending on the model. Disconnect the rest.

C.- MONITOR. Carry out the following procedure:

- 1.- Disconnect MAT, FOCUS, POWER SUPPLY, THERMISTORS, DEFLECTORS, HARNESS OF RGB, in this order.
- 2.- Manipulate the board without touching the metallic parts with the hands or with some tool.
- 3.- Unload the condenser C55 using a resistance (for example 100 Ohm/ 2W) being careful not to touch the terminals with the hands.
- 4.- When mounting it, carry out step one inverted.

SUBSTITUTION OF THE TUBE

The tube and its holder are entirely taken out by the rear side. It is not necessary to remove the glass or the filter.

- A.- Disconnect the harness and the RGB board.
- B.- Unblockade the support by means of the bolts.
- C.- Withdraw the holder and tube set.
- D.- Untwist the screw and take out the tube.

SUBSTITUTION OF THE FLUORESCENT LIGHT

The fluorescent light is taken out by the rear side.

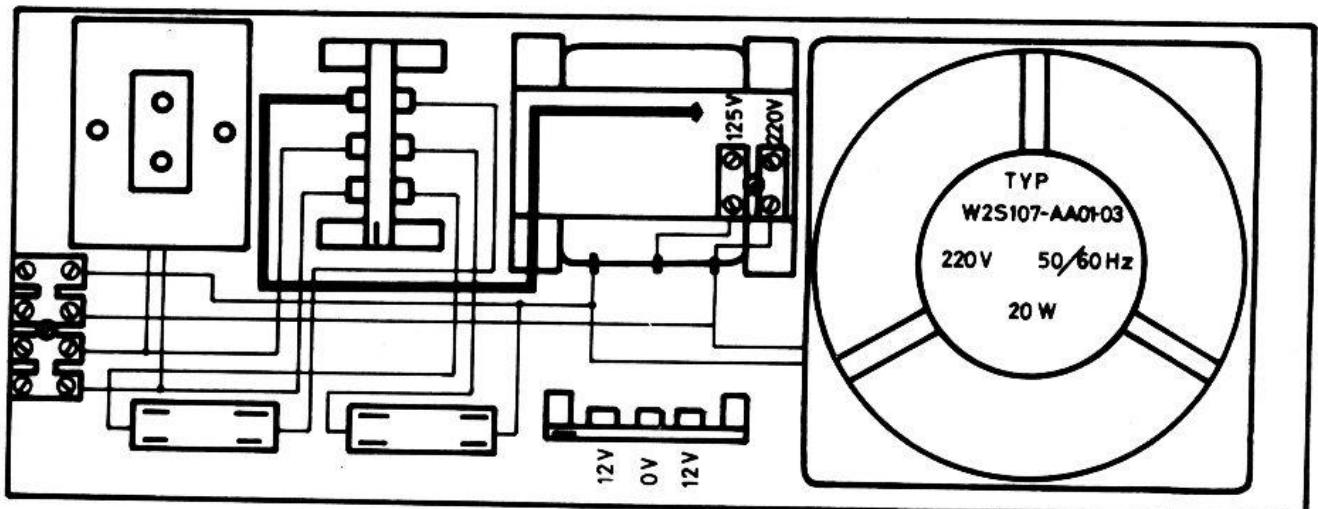

- A.- Open the rear top door.
- B.- Take out the door - latch and pull softly until the holder of the fluorescent light comes to sight.

SUBSTITUTION OF THE GLASS

- A.- Follow the same procedure as for the substitution of the fluorescent light.

- B.- Take out the wall brackets which hold the front panel.

Once this has been done, lift up the top metal bar and the glass will be ready to be changed.

transformer tablet

figure 2

ADJUSTMENT OF THE MONITOR

If, for any reason, the monitor wants to be adjusted (COPRESA or VIDEOCOLOR) starting from zero, disconnect the SYNCHRO board of the base board and carry out the steps which follow. If only a final adjustment is required, read the instructions given under the heading of "Monitors maintenance repairs".

A.- With all the harnesses that go to the monitor disconnected, start the following sequence:

- 1.- Turn all the potentiometers of the three boards (BASE, RGB and SYNCHRO) counter-clock to its most position.
- 2.- Feed with 220V the BASE board (connector J17) and check that the 115V rectifier diode cathode (D14) there is voltage. At the diode cathode (D13) there must be the double approximately. At the diode cathode (D15) there must be five times less approximately. At the diode cathode (D16) there must be seven times less approximately.
- 3.- Cut the 220V power supply and introduce the SYNCHRO board.
Connect deflectors TRC (connector J14).
Connect board RGB to the tube (TRC).
Connect board RGB (connector J12) to the board BASE (connector J15).
Connect MAT.
Connect board RGB (connector J13) to the board VIS (connector B1-B5).
- 4.- Feed with 220V. The screen must not lit. The filament of the TRC must lit. Apply test chart signal by means of TEST push button.
- 5.- Adjust the voltage of the rectifier cathode (D14) at 115V, by means of the potentiometer (P7) of the power supply.
Check the voltage of the diodes (D13, D15, D16) which must be of 210, 25 and 17V respectively, within a range of the 10% variation.
- 6.- Adjust the voltage of the grid 2 at 390V (central pin of the potentiometer) (P6), by means of such potentiometer.

- 7.- Turn the black level potentiometers of the RGB board until the screen lits. Cross the base of transistor SCl48 (T8) of the SYNCHRO board to earth and adjust the horizontal frequency potentiometer until the image become stable. Eliminate the cross to earth. The image must become horizontally synchronized.
- Adjust the vertical frequency potentiometer (P2) (BASE) until the image becomes vertically synchronized.
- Touch up the focus control, located in the tripler, in order to focus.
- 8.- Adjust amplitude (P3) and vertical lineality (P1) board BASE, so that the image acquire the necessary width and all the squares have the same amplitude.
- Touch up the vertical frequency control (P2).
- 9.- (ONLY APPLIES TO TUBE PHILIPS A51-570X) Adjust the potentiometer of correction E-0 (P5) until the vertical lines of the end become most straight.
- 10.- (ONLY APPLIES TO TUBE PHILIPS A51-570X) Adjust the horizontal amplitude control (P4) until the image have the correct dimension. Take care that the correction E-0 does not deteriorate.
- 11.- (ONLY APPLIES TO VIDEOCOLOR TUBE A51-421X) To adjust the horizontal amplitude, touch up the coil core AZ3147.
- 12.- If the horizontal centred is not correct, touch up the coil core AZ3520. If the vertical centred is not correct, touch up the 180-220 ohms 1W (R56) resistance, in the vertical deflection circuit.
- 13.- Disconnect the blanking (crossing to earth the base of the SCl48 transistor (T7) of the RGB board), connect to earth the RGB inputs (connector J13). Adjust the three canyons KG, KR, KB, to 150V, by means of the black level potentiometers of the RGB board.
- 14.- Connect adjustment signal once more and touch up the gain potentiometers of the three canyons (RGB board) until white is obtained.
- 15.- Perform the last adjustment checking following the former steps.

MONITORS MAINTENANCE REPAIRS

- 1.- If the image is not stable, appearing decomposed in diagonal stripes, touch up the horizontal frequency potentiometer located in the SYN-CHRO board.
- 2.- If the image is not stable, jumping sideways, touch up the vertical frequency potentiometer (P2) located in the BASE board.
- 3.- If the brightness is in excess or insufficient, touch up the brightness potentiometer (P6) located in the BASE board.
- 4.- If the image does not focus properly, touch up the focus potentiometer, located in the tripler, paying more attention in the words GAME OVER.
- 5.- If any of the colours is prevailing over the others or insufficient, touch up the gain potentiometer corresponding to the colour, located in the RGB board, as follows: G for Green, B for Blue, R for Red. Do not touch, in any case, the black level adjustment potentiometer located in the same board.

STATE OF TEST

- TEST OF CONTACTS, ADJUSTMENTS.

To enter in this state press the red button located in the internal part of the door when the machine is in game over.

In the screen it will appear the test chart of the monitor, the list of adjustments and the image of the contacts ("0" = open, "1" closed).

To pass this test, switch off and on the machine.

- TEST OF THE BOARD OF PLAY

This test is started when the machine is being started with the red button pressed and setting it free afterwards.

During the cycle it makes 22 steps checking in each one of them the following components:

STEPS	COMPONENT
1	EPROM A IC 10
2	" B IC 11
3	" C IC 12
4	" D IC 13
5	" E IC 14
6	" F IC 15
7	" G IC 16
